

MOM • TASK DELEGATION • ANALYTICS

MeetingLens

AI MOM, Task Delegation & Analytics System

From live conversation to transcribed minutes, tracked decisions, delegated tasks, and measurable analytics — automatically.

New: Analytics, OAuth & Live Voice

GLS University, Ahmedabad

Problem Statement

Manual minute-taking is slow and error-prone

Someone must dedicate full attention to typing notes during a meeting, which is tiring and often incomplete.

Decisions and action items get lost

Without a structured record, key decisions and to-dos live only in memory or scattered chat messages.

Follow-up is inconsistent

Assigning owners, notifying them, and scheduling follow-ups is manual, so tasks slip through the cracks.

No searchable, auditable history

Past meetings aren't stored in a structured, queryable way — tracing back a decision is difficult.

Proposed Solution & Expected Outcome

WHAT THE SYSTEM DOES

Capture the conversation

Live browser transcription (Web Speech API) or an uploaded transcript.

AI extracts structure

Google Gemini reads the transcript and returns MOM, decisions & action items.

Human-in-the-loop approval

Reviewer approves / edits AI-suggested tasks before anything is finalized.

Automatic delegation

Approved tasks are emailed to owners with a MOM PDF and a calendar link.

EXPECTED OUTCOME

Meeting minutes generated within seconds of a transcript being available.

Zero decisions or action items lost — every one stored with a confidence score.

Every approved task auto-delegated by email with a ready calendar invite.

A searchable history of meetings, decisions, and task ownership over time.

Key Platform Capabilities

Five pillars that turn raw conversation into tracked, delegated, measurable work.

Analytics & Reports Hub

Full dashboard for meeting insights, task-completion metrics, and exportable statistics.

Enhanced Auth & Security

Google Social Login (OAuth 2.0), OTP-based password reset, and profile customization.

Real-Time Voice & Live Transcription

Web Speech API with live browser audio capture and continuous AI processing.

Automated Email & Calendar Sync

Task delegation emails with attached MOM PDFs and one-click Google Calendar events.

Document Repository & PDF Generator

TXT / PDF / DOCX uploads plus instant PDF generation for transcripts and summaries.

Workflow Diagram

Extended with secure sign-in at the start and analytics at the close of the loop.

Human approval gate before anything is finalized or delivered — and every step now feeds the Analytics dashboard.

Technologies & Tools

React.js + Vite

Frontend SPA & fast dev tooling

Web Speech API

In-browser live transcription

PHP REST API

Backend business logic

MySQL 8.0

Users, meetings, tasks, decisions

Google OAuth 2.0 + OTP

Social login & password reset

Google Gemini AI

MOM & action-item extraction

PDF Generation

Downloadable meeting minutes

Email Dispatch (PHPMailer)

Task delegation notifications

Google Calendar Link

One-click follow-up scheduling

Analytics Engine

Reports & dashboards for the team

Frontend Pages & Architecture

13 React views grouped by role in the workflow.

Auth & Onboarding

- LandingPage — hero & feature showcase
- Auth — login, register, Google OAuth
- ForgotPassword — OTP-based reset

Core Workflow

- Dashboard — recent meetings & stats
- NewMeeting — upload transcript
- VoiceMeeting — live recording
- MeetingDetails — MOM, chat, tasks
- TaskApproval — review AI tasks
- Tasks — assigned & delegated

Insights & Management

- Reports — analytics & trends
- Documents — MOM PDF archive
- Settings — profile & preferences

Pseudocode of the Proposed Approach

START

- Launch the app; check login/session (incl. Google OAuth) and route to Landing or Auth page.
- Let the user choose a meeting mode: Live Voice or Upload.
- Live Voice: capture audio via the Web Speech API and build a transcript.
- Upload: extract the transcript from the uploaded TXT / PDF / DOCX file.
- Send the transcript to the backend and call the Gemini AI API (cURL) with a valid key.
- Parse the JSON response and return the MOM, decisions & action items to the frontend.

CONTINUED

- Display results on the Meeting Details screen for human review and edits.
- Save approved action items to the MySQL database.
- Let the user approve and delegate the finalized tasks.
- Generate the MOM PDF with a calendar link and email it to the assignee (PHPMailer).
- Update the Dashboard with the meeting summary and task list.
- Refresh the Analytics & Reports Hub with the new meeting's metrics.

STOP

Assumptions, Challenges & Queries

Assumptions

- Users access the app on a Chromium-based browser supporting the Web Speech API
- Meetings are conducted primarily in English
- Assignees have a valid email and Google account for Calendar & OAuth
- Google Gemini API stays available within expected rate limits

Challenges

- Speech recognition accuracy drops with accents, overlapping speakers, or noise
- Long transcripts may approach Gemini's context/token limits
- AI-extracted action items need reliable confidence scoring, not just guesses
- OTP email deliverability and OAuth consent friction at scale

Open Queries

- Should the system support languages beyond English?
- What's the fallback when the Gemini API fails or confidence is low?
- Should reviewers hand-edit MOM text, not just approve tasks?
- How far back should Analytics trends be computed for new accounts?
